Microsoft

UPGRADE: Transition your MCPD Enterprise Application Developer Skills to MCPD Enterprise Application Developer 3.5, Part 2

OfficialCerts.com is a reputable IT certification examination guide, study guides and audio exam provider. We ensure that you pass your 70-569 exam in first attempt and also get high scores to acquire Microsoft certification.

If you use OfficialCerts 70-569 Certification questions and answers, you will experience actual 70-569 exam questions/answers. We know exactly what is needed and have all the exam preparation material required to pass the exam. Our Microsoft exam prep covers over 95% of the questions and answers that may be appeared in your 70-569 exam. Every point from pass4sure 70-569 PDF, 70-569 review will help you take Microsoft 70-569 exam much easier and become Microsoft certified.

Here's what you can expect from the OfficialCerts Microsoft 70-569 course:

- * Up-to-Date Microsoft 70-569 questions as experienced in the real exam.*
- * 100% correct Microsoft 70-569 answers you simply can't find in other 70-569 courses.*
- * All of our tests are easy to download. Your file will be saved as a 70-569 PDF.*
- * Microsoft 70-569 brain dump free content featuring the real 70-569 test questions.*

Microsoft 70-569 certification exam is of core importance both in your Professional life and Microsoft certification path. With Microsoft certification you can get a good job easily in the market and get on your path for success. Professionals who passed Microsoft 70-569 exam training are an absolute favorite in the industry. You will pass Microsoft 70-569 certification test and career opportunities will be open for you.

Question: 1

You are creating a distributed application by using Microsoft .NET Framework 3.5. You use Windows Communication Foundation (WCF) to create the application. The operations provided by the WCF server use the remote resources of other computers. These methods use the credentials provided by the client applications. You need to ensure that the WCF server can impersonate the client applications to access the remote resources. Which client application settings should you use?

- A. `<windows allowedImpersonationLevel="Delegation"/>`
- B. `<windows allowedImpersonationLevel="Impersonation"/>`
- C. `<windows allowedImpersonationLevel="Identification"/>`
- D. `<windows allowedImpersonationLevel="Impersonation" allowNtlm="false"/>`

Answer: A

Question: 2

You are creating a Windows Communication Foundation (WCF) service by using Microsoft .NET Framework 3.5. You need to host the WCF service on the IIS Web server. First, you create a new folder for your application files. Next, you use the IIS management tool to create a Web application in the new folder. Which three actions should you perform next? (Each correct answer presents part of the solution. Choose three.)

- A. Create a web.config file that contains the appropriate configuration code. Place this file in the application folder.
- B. Create a web.config file that contains the appropriate configuration code. Place this file in the same folder as your service contract code.
- C. Create a service file that has the .svc extension containing the @service directive information for the service. Move this file to the application folder.
- D. Create a service file that has the .svc extension containing the @servicehost directive information for the service. Move this file to the application folder.
- E. Create a vti_bin sub-folder within the application folder for your code files. Place the code file that defines and implements the service contract in this folder.
- F. Create an App_Code sub-folder within the application folder for your code files. Place the code file that defines and implements the service contract in this folder.

Answer: A, D, F

Question: 3

You are creating a Windows Communication Foundation service by using Microsoft .NET Framework 3.5. You write the following code segment.

```
namespace MyServices
{
    [ServiceContract()]
    interface IManageOrders
    {
        ...
    }
}
```

The service metadata must be exposed at the relative address named meta.

You need to add an endpoint element to the app.config file of the service host. Which code fragment should you add?

- A. <endpoint address="meta" binding="wsHttpBinding" contract="IMangeOrders" />
- B. <endpoint address="meta" binding="wsHttpBinding" contract="MyServices.IMetadataExchange" />
- C. <endpoint address="meta" binding="mexHttpBinding" contract="IMetadataExchange" />
- D. <endpoint address="meta" binding="mexHttpBinding" contract="MyServices.IMangeOrders" />

Answer: C

Question: 4

You create an application by using Microsoft Visual Studio .NET 2008 and the .NET Framework 3.5. The application will be used by multiple types of users. The application will also interact with external applications. You need to design the interaction among the application, the users of the application, and the external applications. What should you do?

- A. Create a class diagram.
- B. Create a timing diagram.
- C. Create a Use case diagram.
- D. Create a state machine diagram.

Answer: C

Question: 5

You are creating a Windows Communication Foundation (WCF) service by using Microsoft .NET Framework 3.5. The WCF service will validate certificates to authorize client applications. You write the following code segment.

```
class Store: IStore
{
public void RemoveOrder(int ordered)
{}
}
```

You need to ensure that only those client applications that meet the following criteria can access the RemoveOrder method:

"AdminUser" is the subject in the client certificate.

"1bf47e90f00acf4c0089cda65e0aadcf1cedd592" is the thumbprint in the client certificate.

What should you do?

- A. Decorate the RemoveOrder method by using the following attribute.
[PrincipalPermission(SecurityAction.Demand, Name="AdminUser; 1bf47e90f00acf4c0089cda65e0aadcf1cedd592")] Initialize the serviceAuthorization element of the service behavior in the following manner. <serviceAuthorization principalPermissionMode="Windows"/>
- B. Decorate the RemoveOrder method by using the following attribute.
[PrincipalPermission(SecurityAction.Demand, Role="CN=AdminUser, 1bf47e90f00acf4c0089cda65e0aadcf1cedd592")] Initialize the serviceAuthorization element of the service behavior in the following manner. <serviceAuthorization principalPermissionMode="Windows"/>
- C. Decorate the RemoveOrder method by using the following attribute.
[PrincipalPermission(SecurityAction.Demand, Role="AdminUser, 1bf47e90f00acf4c0089cda65e0aadcf1cedd592")] Initialize the serviceAuthorization element of

the service behavior in the following manner. <serviceAuthorization principalPermissionMode="UseAspNetRoles"/>

- D. Decorate the RemoveOrder method by using the following attribute. [PrincipalPermission(SecurityAction.Demand, Name = "CN=AdminUser; 1bf47e90f00acf4c0089cda65e0aadcf1cedd592")] Initialize the serviceAuthorization element of the service behavior in the following manner. <serviceAuthorization principalPermissionMode="UseAspNetRoles"/>

Answer: D

Question: 6

You are creating a client application by using Microsoft .NET Framework 3.5. You use Windows Communication Foundation (WCF) to create the application. The client application uses a Personal Information Card to provide authentication information to the WCF server. You write the following code fragment. (Line numbers are included for reference only.)

```
01 <wsFederationHttpBinding>
02 <binding name="requireCardSpace">
03 <security mode="Message">
04 <message >
05
06 </message>
07 </security>
08 </binding>
09 </wsFederationHttpBinding>
```

You need to ensure that one of the claims in the Personal Information Card contains an e-mail address. Which code fragment should you insert at line 05?

- A. <claimTypeRequirements> <add claimType="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress" isOptional="false"/></claimTypeRequirements><issuer address="http://schemas.xmlsoap.org/ws/2005/05/identity/issuer/personal"/>
- B. <claimTypeRequirements> <add claimType="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress"/></claimTypeRequirements><issuer address="http://schemas.xmlsoap.org/ws/2005/05/identity/issuer/personal"/>
- C. <claimTypeRequirements> <add claimType="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress"/></claimTypeRequirements><issuer address="http://schemas.xmlsoap.org/ws/2005/05/identity/issuer/managed"/>
- D. <claimTypeRequirements> <add claimType="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress" isOptional="false"/></claimTypeRequirements><issuer address="http://schemas.xmlsoap.org/ws/2005/05/identity/issuer/self"/>

Answer: D

Question: 7

You are creating a Windows Communication Foundation service by using Microsoft .NET Framework 3.5. The service contains the following binding configuration in the configuration file. (Line numbers are included for reference only.)

```
01 <wsHttpBinding>
02 <binding name="ssl">
03
04 </binding>
05 </wsHttpBinding>
```

You need to ensure that the following requirements are met:

The service must use transport-level security (SSL via HTTPS).

The service must use message-level security to authenticate client applications by using user name and password. Which configuration setting should you insert at line 03?

- A. `<security mode="Message"> <message clientCredentialType="UserName"/></security>`
- B. `<security mode="TransportWithMessageCredential"> <message clientCredentialType="UserName"/></security>`
- C. `<security mode="Transport"> <transport clientCredentialType="Windows"/> <message clientCredentialType="UserName"/></security>`
- D. `<security mode="Message" > <transport clientCredentialType="Windows" /> <message clientCredentialType="UserName" /></security>`

Answer: B

Question: 8

You are creating a Windows Communication Foundation service by using Microsoft .NET Framework 3.5. You write the following code fragment for the configuration setting. (Line numbers are included for reference only.)

```
01 <wsHttpBinding>
02 <binding name="simple">
03
04 </binding>
05 </wsHttpBinding>
```

You need to ensure that the service uses transport security and allows access to anonymous client applications. Which code fragment should you insert at line 03?

- A. `<security mode="Transport" > <transport clientCredentialType="Basic" /></security>`
- B. `<security mode="Transport" > <message clientCredentialType="None"/></security>`
- C. `<security mode="Transport" > <message clientCredentialType="Certificate"/></security>`
- D. `<security mode="Transport" > <transport clientCredentialType="None" /></security>`

Answer: D

Question: 9

You are creating a distributed client application by using Microsoft .NET Framework 3.5. You use Windows Communication Foundation (WCF) to create the application. You specify the following configuration settings for the service application.

```
<serviceCredentials>
<userNameAuthentication
userNamePasswordValidationMode="MembershipProvider"
membershipProviderName="SqlMembershipProvider"/>
</serviceCredentials>
```

You need to authenticate the client application by using the Microsoft ASP.NET membership provider. Which configuration settings should you use?

- A. `<wsHttpBinding> <binding name="http"> <security mode="Message"> <message clientCredentialType="IssuedToken"/> </security> </binding></wsHttpBinding>`

OfficialCerts.com Certification Exam Full Version Features;

- Verified answers researched by industry experts.
- Exams **updated** on regular basis.
- Questions, Answers are downloadable in **PDF** format.
- **No authorization** code required to open exam.
- **Portable** anywhere.
- 100% success **Guarantee**.
- **Fast**, helpful support 24x7.
