- A. ApprovalTransform.xslt
- B. ERManifest.xml
- C. ExpenseReport.doc
- D. ExpenseReport.dll
- E. ExpenseReport.xsd

Answer: B, D

Question: 2

You develop XML solutions using Microsoft Office Professional Enterprise Edition 2003 for Company.com.

You use Microsoft Office InfoPath 2003 SP1 to create an expense report form.

The form contains five required fields for each expense. If the expense is travel related, the user must complete three additional travel-related fields.

You need to ensure that the travel-related fields are shown only when the user indicates that the expense is travel related.

What should you do?

- A. Create multiple views.
- B. Create multiple tables
- C. Include a Choice Group control.
- D. Include multiple section controls.

Answer: D

Question: 3

You develop XML solutions using Microsoft Office Professional Enterprise Edition 2003.

You are creating an XML schema for a Microsoft Office Word 2003 template. Service technicians use the template to create incident reports. Service technicians collect data about each customer incident in a tabular format.

You need to ensure that data about each incident is saved as XML in the correct sequence.

What should you do?

- A. Add the attribute sequence="true" to the schema element.
- B. Add the attribute sequence="true" to each complexType element.
- C. Include a sequence element as a child element of the schema element

Answer: D

Question: 4

You develop client solutions for Company.com.

A Microsoft Office 2003 application running on client computers sends a query message that is based on the Microsoft.Search.Query schema to a custom Research service.

The custom Research service returns a query response message that creates a user interface in the task pane.

The user interface is formatted as a set of CheckBox controls. The CheckBox labels are based on values that are returned by the query. The query searches documents that are stored in a Microsoft SQL Server 2000 database.

You discover that some of the client computers running the Office 2003 application do not have Microsoft .NET Framework installed.

You need to format the query response based on a schema that resolves as the appropriate user interface. Your solution must work on all client computers running the Office 2003 application. What should you do?

- A. Base the query response message on the Microsoft.Search.Reponse.Form schema
- B. Base the query response message on the Microsoft.Search.Response.Content schema
- C. Base the query response message on the Microsoft.Search.Response.Document schema
- D. Base the query response message on a custom schema that implements a smart document assembly.

Answer: A

<element name="Row" maxOccurs="unbounded">
<complexType>
<element name="EmployeeID" type="integer" />
</complexType>
</element>
</complexType>
</element>
</schema>

```
Dim xmp As XmlMap
Set xmp = _
ActiveWorkbook.XmlMaps.Add("c:\SalesData\Employees.xsd")
'Insert code here

You need to map the column that contains the EmployeeID data to column B in the worksheet. The column header should appear in cell B1.

What code should you add to the method?

- A. Dim xp as XPath
Set xp = ActiveSheet.Range("B1").XPath
xp.Value= "@EmployeeID"
- B. Dim xp as XPath
Set xp = ActiveSheet.Range("B1").XPath
xp.SetValue xmp, "@EmployeeID", , True
